

RePOSce

Sales Force Ordering Systems

RePOSce is a Route Sales and Remote Ordering application with all the features that a salesperson needs to maximize efficiency and profitability. Features including sales and order history, real-time warehouse on hand data, accounts receivable, order profit reports, credits, and suggested orders make RePOSce the most powerful and complete remote ordering and field service application available.

RePOSce uses cellular and WiFi wireless networks, or a portable modem, to transmit orders and data from the field to your facility. Wireless configurations are now abundant, fast and affordable, and eliminate the need for modems and land lines. When out of range, the orders will be stored and transmitted automatically when the device returns to a cellular coverage area. RePOSce supports two way email and text messaging, and permits cordless label and invoice printing using Bluetooth technology.

Real-time access to inventory data is an invaluable tool for a salesperson. Knowing what is available and which substitutes to offer drives higher sales. No other sales force automation product offers the features, versatility and connectivity options found in RePOSce.

Simply put, *DataPort® is the difference.* All Taylorored Technologies products are designed to seamlessly integrate with our DataPort® Enterprise Communications Server, allowing our customers to realize the advantages of implementing new technologies without the expense and disturbance of having to replace their existing backend systems.

RePOSce has the features you demand

- Orders
- Credits
